Before examining moss, a learner predicts: "Moss is like maize. It has true roots and flowers." Which statement about moss is correct?

- A** Moss is a fungus, like a mushroom, so it has no green parts
- B** Moss has true roots, but they are shorter than those of maize
- C** Moss has no flowers and reproduces using spores, not seeds
- D** Moss has flowers but they are too small to see

A learner looks at the base of a moss plant with a hand lens and sees many thin, thread-like structures going into the soil. What are they and what is their main job?

- A** Rhizoids that anchor the plant
- B** True roots that carry water up through xylem
- C** Root hairs that carry food down through phloem
- D** Spore capsules that release spores into the soil

A group makes a labelled biological drawing of one moss plant. Which drawing is done correctly?

- A** It is shaded to show colour, with label lines that cross each other so all labels fit
- B** It has curved label lines drawn over the structures to show exactly where each part is
- C** It has a title and magnification, uses a sharp pencil with single clear lines, and has straight label lines that do not cross
- D** It has no title, so the drawing looks neat and uncluttered

A group compares moss with a maize seedling in a table. Which row of differences is correct?

- A** Moss: large size and true leaves. Maize: very small size and no leaves.
- B** Moss: flowers and seeds. Maize: spore capsules on stalks.
- C** Moss: rhizoids, no vascular tissue, spore capsules. Maize: true roots, xylem and phloem, seeds.
- D** Moss: true roots and xylem. Maize: rhizoids and no vascular tissue.

Maize carries water up its stem through xylem. Moss has no xylem or phloem. What does this lack of vascular tissue tell us about moss?

- A** It grows tall in dry places because it does not need water
- B** It cannot make food because it has no phloem
- C** It stays small because it has too many rhizoids
- D** It stays small because it cannot transport water and food over long distances

A learner finds moss growing on a damp, shaded wall in Nairobi, but none on a dry, sunny rock nearby. Which statement best explains this and how the moss reproduces?

- A** Moss needs deep true roots to reach water, so it grows only on walls
- B** Moss needs bright sunshine to form seeds, so it avoids the dry rock
- C** Moss reproduces by flowers that open only in shade
- D** Moss needs water for fertilisation and has no vascular tissue to bring water from far away, so it lives in damp places and reproduces by spores

A group is adding a 'Bryophyta' category to its classification model. Which criterion is most useful for deciding whether a plant belongs in the group?

- A** It has no true roots, stems or leaves, has rhizoids, and bears spore capsules on stalks
- B** It is green in colour
- C** It is not used as food by people
- D** It is small enough to fit in your hand
