

Quick Check

Lesson 1: Same Hot Afternoon, Different Bodies: Launching the Excretion and Homeostasis Puzzle

7 multiple-choice questions • choose A, B, C or D

Sub-Strand 3.3: Excretion and Homeostasis in Animals | Lesson 1

Learners compared tilapia from Lake Victoria with other animals in their group tables. What is the main nitrogenous waste of a freshwater fish such as tilapia?

A Freshwater fish do not make any nitrogenous waste

B Uric acid

C Ammonia

D Urea

A locust and a housefly are insects. Which structures do they use to remove nitrogenous waste from the body?

- A** Kidneys only
- B** Lungs
- C** Malpighian tubules
- D** Gills with chloride cells

The white, paste-like part of a chicken's droppings is mainly which substance?

- A** Uric acid
- B** Urea
- C** Ammonia
- D** Undigested food (egested waste)

Groups compared animals that must save water with animals that have plenty of water. Which pair of statements matches the pattern in their tables?

- A** Animals that must save water make ammonia in lots of dilute urine, and animals with plenty of water make uric acid paste
- B** All animals make the same waste and use the same amount of water
- C** Animals with plenty of water make uric acid, and animals that save water make ammonia
- D** Animals that must save water make uric acid paste using very little water, and animals with plenty of water make ammonia in dilute urine

Which statement correctly compares the urine of freshwater fish and marine fish, as recorded in the group tables?

- A** Freshwater fish produce very little concentrated urine, while marine fish produce large amounts of dilute urine
- B** Freshwater fish produce large amounts of dilute urine, while marine fish produce very little concentrated urine
- C** Both produce large amounts of dilute urine
- D** Neither freshwater fish nor marine fish produce urine

After this lesson the class has data on fish, insects and birds. Which part of the hot-afternoon puzzle is still NOT yet explained, and is marked with a question mark on the class model?

- A** Which nitrogenous waste freshwater fish such as tilapia make
- B** Why the white part of chicken droppings is a paste and not a liquid
- C** How a goat that has been drinking water produces concentrated urine
- D** Which structures insects use to remove waste

Learners wrote questions on sticky notes for the Driving Question Board. Which question is the best 'how or why' question for investigating the goat in the puzzle?

A Is a goat an animal?

B What is urine?

C How do goats make concentrated urine even after they drink water?

D Name one animal that lives in Lake Victoria.
