

Quick Check

Lesson 2: Inside the Goat Kidney: Cortex, Medulla, Pelvis and Nephrons

7 multiple-choice questions • choose A, B, C or D

Sub-Strand 3.3: Excretion and Homeostasis in Animals | Lesson 2

A learner predicts that a goat's kidney is just a hollow bag that stores urine. Which action would best test this prediction?

- A** Weigh the kidney and compare it with the weight of a full bladder
- B** Cut the kidney lengthwise and observe the inside
- C** Look only at the colour of the outside of the kidney
- D** Measure the length of the kidney from top to bottom

A goat kidney is cut lengthwise. Which region is the darker outer part with a fine, grainy texture?

A Ureter

B Cortex

C Renal pelvis

D Medulla

At the hilum of a kidney, which pair correctly names the vessel that brings blood to the kidney and the tube that carries urine away from it?

- A** Renal vein brings blood; ureter carries urine
- B** Renal artery brings blood; ureter carries urine
- C** Ureter brings blood; renal artery carries urine
- D** Renal artery brings blood; renal vein carries urine

In a cut goat kidney, the funnel-shaped hollow space leads into the ureter. What is the main job of this region, the renal pelvis?

- A** It collects urine and funnels it into the ureter
- B** It stores urine for many hours until the goat urinates
- C** It makes urine by filtering blood
- D** It brings blood into the kidney

Tiny granular dots can be seen in the cortex of a kidney with a hand lens. What is the nephron?

- A** The fatty layer that covers the outside of the kidney
- B** The microscopic functional unit of the kidney
- C** The funnel-shaped space where urine collects
- D** The tube that carries urine from the kidney to the bladder

A goat and a freshwater fish live in the same hot area. Which statement best links kidney structure to what each animal does with water?

- A** The goat makes concentrated urine because its pelvis makes urine, while the fish has no kidney
- B** The goat's kidney has no medulla, so it makes dilute urine, while the fish's kidney makes concentrated urine
- C** Both animals make the same urine because all kidneys have the same structure
- D** The goat's kidney has a well-developed medulla that helps it make concentrated urine, while the fish's kidney mainly gets rid of excess water as dilute urine

Which order correctly traces the path of fluid through the regions of a kidney, from where it is filtered to where it leaves?

A Cortex, medulla, pelvis, ureter

B Medulla, cortex, ureter, pelvis

C Pelvis, medulla, cortex, ureter

D Cortex, pelvis, medulla, ureter
